Lab 11: UAT

Test 1:
Account: User will create an account and then login to the website. If they can create an account, then login to it this will be successful, if they do not authenticate then it is failed. This can be seen by if they get redirected to our site or get an error. Users will use their own name and login. We will use the cloud. We will find CS undergrads to test our product as they are our target market

Test 2:
Information Loading: User will upload their Degree audit. The test is if their classes get loaded correctly into our site or not. We will use the cloud. We will find CS undergrads to test our product as they are our target market

Test 3:
Classes Popup: User will be able to click on classes and a pop up appears with correct information. If the information is wrong or the pop up does not pop up the test fails. If it pops up with the correct info then it passes. Users will use their own data that they added in test 2 We will use the cloud. We will find CS undergrads to test our product as they are our target market
